

BioResonance is an umbrella term, traditionally used to describe the **interaction** between the **bio-field of a living organism** and the **frequency patterns** that interact with specific parts of it.

BioResonance Feedback Therapy (BRFT) is a diagnostic and therapeutic method of alternative medicine.

BioResonance Feedback Therapy (BRFT)

To understand how BRFT works, we acknowledge that every material is made up of **atoms** which in turn are made up of **subatomic particles**. These subatomic particles behave like energy and **radiate energy** into their surroundings in specific **patterns**.

The **unique vibration patterns**, or oscillations, of normal-functioning body systems and organs as well as those of allergies, bacteria and toxins have been **analyzed by researchers**. Similarly, electrocardiography (ECG) measures heart currents and electroencephalography (EEG) measures brain vibrations.

When we are **sick**, the vibration of foreign substances like toxins, pesticides, bacteria and dental amalgams that are stored in our body can **interfere with our natural oscillation image**. If the body's healthy oscillations are weakened or imbalanced, biochemical and metabolic misdirection and malfunction occur that result in dysfunction and disease.

BioResonance Feedback Therapy (BRFT) manipulates the vibration patterns into precise patterns to diminish or strengthen the electromagnetic profile of a particular person.

How does BioResonance Feedback Therapy (BRFT) work?

BioResonance Feedback Therapy (BRFT) uses technology that detects and reads **ultra fine electromagnetic oscillations or vibrations**

produced by every cell, organ, gland and system in the body. The BRFT machine (

[ETA Scan](#)

) separates pathological oscillations (those associated with illness) from the body's natural frequencies.

During the therapy a **mirror-image** of the pathological oscillation is produced, cancelling out its electromagnetic oscillation, **rendering it inert**. This process is similar to passing a strong demagnetizer over magnets – the magnets no longer “stick” to the surface. Toxins are set free and released into the circulation where they have to be expelled quickly through urine, the skin and breathing. This is why it is so important to drink plenty of water after such treatments.

Almost any condition can benefit from BioResonance Therapy. It is **non-invasive, painless and safe to use at any age**.

With this therapy the name of the illness is not important as the ETA Scan properly targets affected systems and organs. In addition, natural physiological oscillation patterns can be amplified or strengthened to optimal levels enabling the body to regain its healthy function again.

What limitations does BioResonance Feedback Therapy (BRFT) have?

Although BRFT has an exceptionally broad spectrum of applications, just like all therapies, it has its limitations

- **Pathologic final stages** – if the tissue is completely destructed it is probably impossible to regenerate.
- **Depriving** the body of **essential nutrients** such as minerals, vitamins, proteins, enzymes, etc. impedes the success of any therapy
- A patient that **does not want to** become healthy can negate BRFT
- The subtle BRFT signal is interrupted by **painkillers, stimulants and alcohol** taken within a day before and a day after the therapy.

BRFT receives your vibrations through a cable attached to an electrode. The electrode pads or probes convey **carrier wave frequencies**. Only your own vibrations are used for the self-regulation, so nothing foreign is given to you from the machine itself. The settings are a combination of **pre-programmed frequencies** and a pattern is chosen by the operator.

BioResonance Feedback Therapy may need to be repeated several times. A single treatment can consist of one or more therapy steps, depending on the state of your health. BRFT does not however, replace your cooperation in the healing process; the **lifestyle** that has made you sick has to be changed too.

What physical reactions to BioResonance Feedback Therapy can be expected?

BioResonance Feedback Therapy is **painless** and to date, **no harmful side effects** have been observed. However, during or after BRFT, a reaction might occur even coincidentally which should be taken note of so that it can be interpreted. Some of the following initial reactions have been reported:

- BRFT enables the **detoxification** and excretion of toxins, so if a large amount of toxins have been accumulated, initial reactions can manifest as **nausea, skin rashes**, etc.
- Treatment can have a very **intensive** effect if the patient is **highly stressed**.
- Temporary healing reactions are usually expressed as general symptoms of **relaxation, tiredness, warmth or coolness, perspiration, fever, slight pains, red flushed skin or inner uneasiness**.
- A **weakened defence system** first has to be **reinforced** in order to actively overcome the illness which is why chronic illnesses first have to be activated as part of the healing process.
- **Earlier illnesses or inflammations** that have not healed properly may feel more noticeable.

The goal of BioResonance Feedback Therapy is to **reduce or eliminate pathological vibrations** and at the same time **strengthen**

What is BioResonance?

Last Updated Monday, 22 August 2011 13:00

n physiological ones.

BRFT has been

tested and approved throughout Europe and Canada,

and is in use in around

55 countries worldwide

. In Germany, where it was developed, BRFT has been in use for

25 years.

Scientific studies have provided objective proof of its effectiveness, and thousands of patients have been helped with BioResonance Feedback Therapy.
